PROFESSIONAL SUMMARY

Full-stack developer with 3+ years building production-grade applications across healthcare and enterprise domains at Stellablue. Experienced end-to-end — from database schema to mobile UI — with a consistent focus on clean architecture, scalable design, and practical AI integration. Driven by a genuine passion for continuous learning and a commitment to problem-solving.

TECHNICAL SKILLS

Frontend	React.js • React Native • Material UI (MUI) • JavaScript ES6+ • Responsive UI
Backend	Spring Boot • REST APIs • JPQL • Native SQL • Multi-tenant Architecture
Database	MySQL • Schema Design • Query Optimisation
AI & LLMs	LLM API Integration • Natural Language → SQL • Prompt Engineering
Tooling	Git • Postman • Selenium (Python) • Ngrok • White-label Deployment

PROFESSIONAL EXPERIENCE

Full Stack Developer - **Stellablue** *(Aug 2022 – present)*

MEDePAL, MHCP — Healthcare Platforms *(React ● React Native ● Spring Boot ● MySQL)*

- **React Native mobile apps:** Developed and maintained **MEDePAL** and its white-labeled variant **MHCP** — end-to-end React Native healthcare platforms covering caregiver workflows, task tracking, patient interactions, doctor and diagnostic test bookings and more.
- **Reusable component library:** Refactored and rebuilt the UI/UX to modern standards by designing a shared React + MUI component library — adopted across multiple modules to drive consistency, eliminate duplication, and future-proof the front-end architecture.
- **Spring Boot REST APIs:** Built DTO-based Spring Boot REST APIs supporting multi-tenant deployments — enabling per-client module toggling and configurable feature sets across a white-labeled platform.
- **Config-driven form engine:** Architected dynamic form systems that eliminated hardcoded UI logic, enabling non-developer configuration and cutting new-form delivery time significantly.
- **Runtime query engine:** Developed a self-serve report generation module allowing common users to build widgets and execute queries through a UI-driven screen — removing the need for backend intervention on ad-hoc data requests.
- **AI / NL-to-SQL feature:** Integrated LLM APIs into the query builder to translate natural language into validated SQL, with server-side checks blocking destructive queries.

Nomura / Mitsubishi Trust Bank — Multi-Tenant Financial System *(Java ● Spring Batch)*

- **Recompilation layer:** Contributed to the recompilation layer of a stock exchange batch processing system — handling recompilations of trade and ledger data across settlement cycles.
- **Multi-tenant architecture:** Worked within a multi-tenant architecture ensuring strict data isolation, tenant-specific configuration, and accurate ledger reconciliation across client accounts.
- **Fintech standards**: Delivered backend and frontend features aligned to fintech compliance standards — operating within regulated code-review processes and enterprise-scale testing and deployment pipelines.
- **Exposure**: Gained hands-on exposure to a live financial production environment — understanding the precision and accountability required in exchange-grade systems handling end-of-day settlements.

KEY PROJECTS

AI-Assisted Query Builder | *LLM APIs ● Spring Boot ● React*
Natural language input is translated to validated SQL via LLM API calls, with server-side checks that block destructive or schema-violating queries before execution. Reduced analyst dependency on engineering for custom reports.

Dynamic Form Engine | *React ● MUI ● Spring Boot ● MySQL*
Config-driven system where form definitions, field types, validation rules, and DB mappings are stored as data — not code. New form types can be added and deployed without a frontend release.

Medepal / MAMATA Mobile Apps | *React Native ● REST APIs*
Cross-platform healthcare apps covering patient records, caregiver task management, and clinical workflows. MAMATA is a white-labeled variant customised for a specific client with distinct branding and module configuration.

Nursing & Caregiver App | *React Native ● Spring Boot*
Role-specific mobile interface for caregivers: shift task tracking, patient interaction logging, and real-time updates

Multi-Tenant Financial Platform (Nomura) | *React ● Spring Boot ● MySQL*
Backend and UI contributions to a multi-tenant system serving Mitsubishi Trust Bank — ensuring tenant data isolation, configurable module access, and compliance with enterprise security standards.

ABDM Integration (Medepal) | *React ● Spring Boot ● MySQL*
End-to-end integration of India's Ayushman Bharat Digital Mission (ABDM) stack into Medepal — covering ABHA ID management, consent-driven PHR access, and FHIR-based health data exchange across HIU and HIP roles per NHA gateway standards.

CORE STRENGTHS

- **End-to-end product ownership** Comfortable delivering a feature from DB schema to mobile UI without handoffs.
- **Mobile + Web delivery** Shipped production of React Native and React apps in parallel across healthcare domains.
- **Practical API integration** Integrated LLM and third-party APIs into production workflows, with validation logics.
- **Scalable system design** Designed config-driven, reusable patterns that reduce long-term engineering overhead.
